Project Reflection: Testimonial Collection SaaS

Course: Agentic Engineering Workflow (Module 13 Assignment) • **GitHub:** https://github.com/Enjamam/Testimonials

1. What worked well with Claude Code & the Agentic Workflow?

Applying the agentic pair-programming workflow with structured specification files (`CLAUDE.md` , `CONTEXT.md`) provided exceptional development velocity and architectural consistency. Explicit boundaries prevented scope creep while keeping business logic and tenant authorization strictly on the server. The plan → implement → verify rhythm worked seamlessly: the agent generated database migrations, Cashier Stripe subscriptions, short branded slugs (`/s/{slug}`), and Inertia React 19 interfaces. Integrating Model Context Protocol (MCP) tooling—notably Chrome DevTools MCP for real-time viewport screenshot audits and DOM inspection—proved invaluable for validating responsive layouts, dark/light theme switching, and celebratory micro-interactions without visual guesswork.

2. Where did it go wrong, and how was it fixed?

Two primary challenges arose during development: avatar file uploads and iframe embed theme clashes. Early settings pages suffered from wide-viewport whitespace, and standard PATCH HTTP requests conflicted with PHP multipart form boundaries; we resolved this with modular card layouts, dual-method routing (`Route::match(['patch', 'post'])`), and atomic disk cleanup tests. Later, the standalone embed widget encountered a dark-mode canvas clash where Chromium rendered transparent iframes as opaque black over host sites; we fixed this by strictly isolating `color-scheme` properties and removing layout-level theme overrides inside embed routes.

3. What would I plan differently next time?

In future agentic projects, I would establish design tokens and reusable UI card primitives during initial project bootstrapping rather than refining them post-implementation. Furthermore, I would integrate automated headless visual regression checks directly into subagent milestone gates from day one, catching UX and spacing gaps before proceeding to final verification.

Submission Deliverables & Repository Verification Index

Submission Requirement	Repository Location & Details
GitHub Repository Link	https://github.com/Enjamam/Testimonials (Public repository)
How to Run the Project	Detailed in `README.md` (Prerequisites, migrations, db:seed, `composer run dev`)
Feature Completion Matrix	Detailed in `README.md` and `docs/IMPLEMENTATION_STATUS.md` (All 12 phases completed)
Agentic AI Tooling	Detailed in `README.md` & `docs/AGENTIC_WORKFLOW.md` (Subagents, Skills, Hooks, MCP tooling)
Screen Recording (2–5 min)	`docs/Testimonials Project-Short.webm` (Duration: 5 min 03 sec, short app walkthrough)
Full Video Walkthrough	`docs/Testimonials Project.mp4` (Duration: 15 min 03 sec, comprehensive feature demo)
Project Reflection	Included in `reflection.docx` and `reflection.pdf` (Word Count: 242 words)
